IceWarp®

WebClient

WebDocuments Editing BETA

With the online version of the popular desktop productivity suite **LibreOffice integrated in WebClient**, users can open and edit Word documents, Excel spreadsheets and Powerpoint presentations directly in the browser, without having to install Office on their computers. No other technology offers **the quality of rendering LibreOffice** brings to browsers, where documents **look exactly the same as on the desktop**. Images, tables, charts, word-art, styles and anything else embedded in the document is there.

The lightweight document management allows users to **work on documents together**: preview, edit, share & notify others. Previous versions of documents are stored and users can easily go back to an older version if needed.

Editable on the go

Accessible and editableon the go, from anywhere with an Internet connection enabling users to increase their productivity, save time and work remotely from multiple locations.

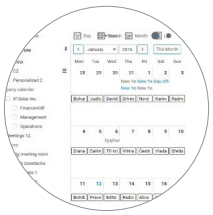

Real time collaboration

Constantly evolving and new features are being added. In the next version, we will introduce **advanced collaboration** and review fetures, enabling teams to work on documents **in real time**.

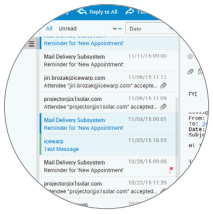

Fullscreen Video

Fullscreen video mode is available for screensharing and video calls so that presentations can fill the entire screen.

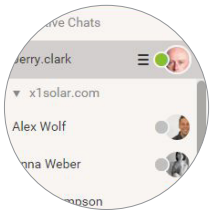

Calendar Printing

Users can now print their calendar including bar graphics, exactly as it appears on the screen.

Compact View

By enabling the new compact view, users can see about 50% more messages, contacts, files without having to scroll.

WebChat Notifications

Unread and recent conversations are easily accessible from the top of the contact list, making the notifications less distracting.

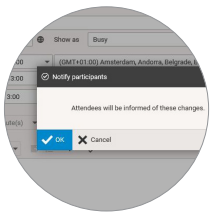

Show Contact Card

Users can access the complete contact information right from the email reading pane and further work with the contact.

Expand a Distribution List

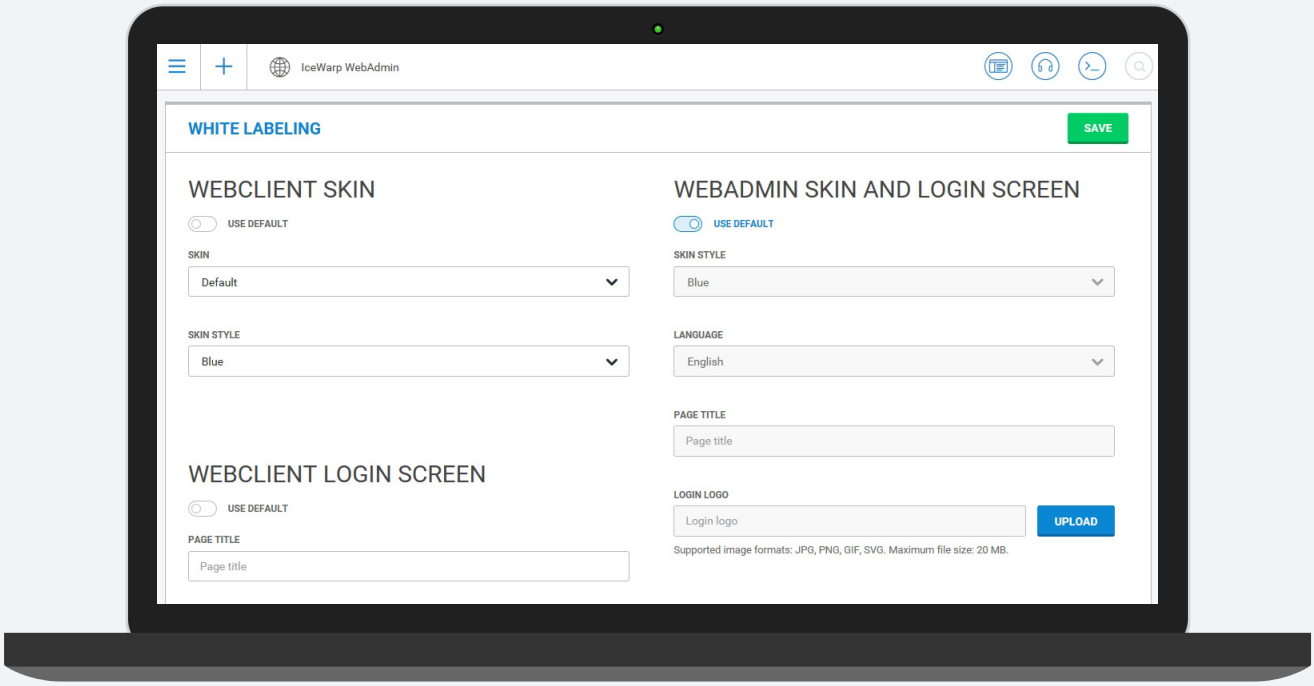

Users can expand their distribution lists to individual recipients and then remove unwanted names from the To: field.

Meeting Invitations

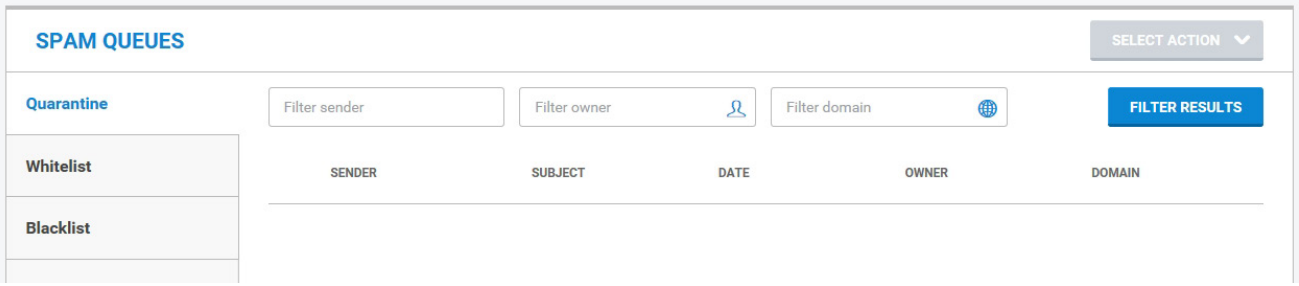

Users can choose whether to notify other meeting attendees when they make minor changes to meetings, or can send all attendees an email.

New WebAdmin

White Labeling

White label options have been moved to one central location for administrators to customize and personalize both the WebAdmin and WebClient look and feel. The wide range of options gives administrators control over the interfaces appearance and gives them the freedom to change colors, logo, preset language or connect to social networks.

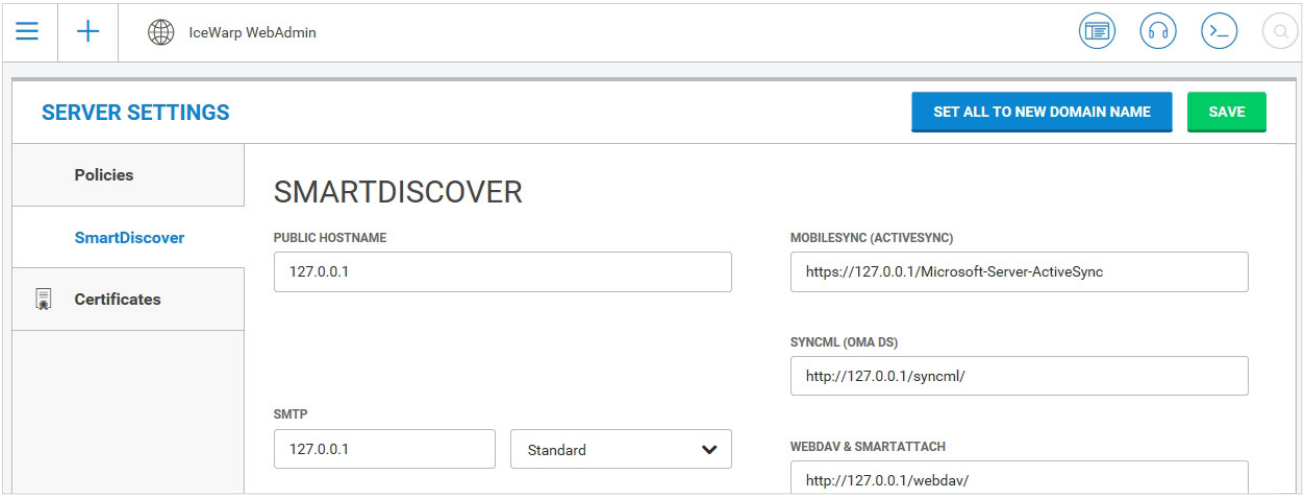

Spam Queues & Gateway Login

Added are the familiar options for spam queue management (Quarantine, Blacklist and Whitelist). Administrators can see and filter the queues and take actions. Thanks to gateway login, end users can now sign in using a security code or email verification, and then blacklist, whitelist senders or manage their quarantined emails.

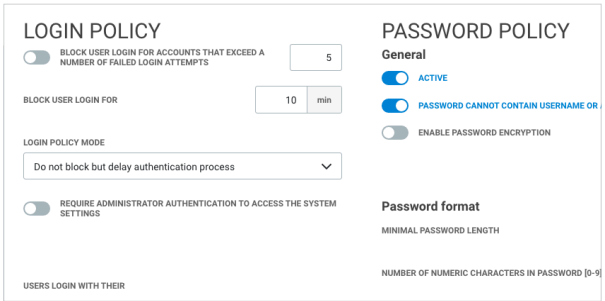

Server Settings

Added are the familiar options from the administration console and old WebAdmin that let administrators configure global server settings.

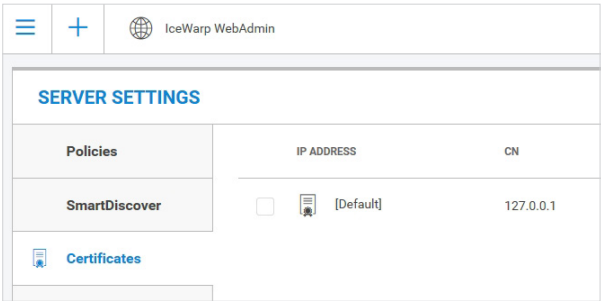

Smart Discover

The auto discovery service is essential for convenient setup of mobile devices, OS X client application as well as Outlook Sync and Em Client. End users only supply their email address and password and all other connection details like available protocols, ports, URLs and server addresses are then retrieved automatically from the server.

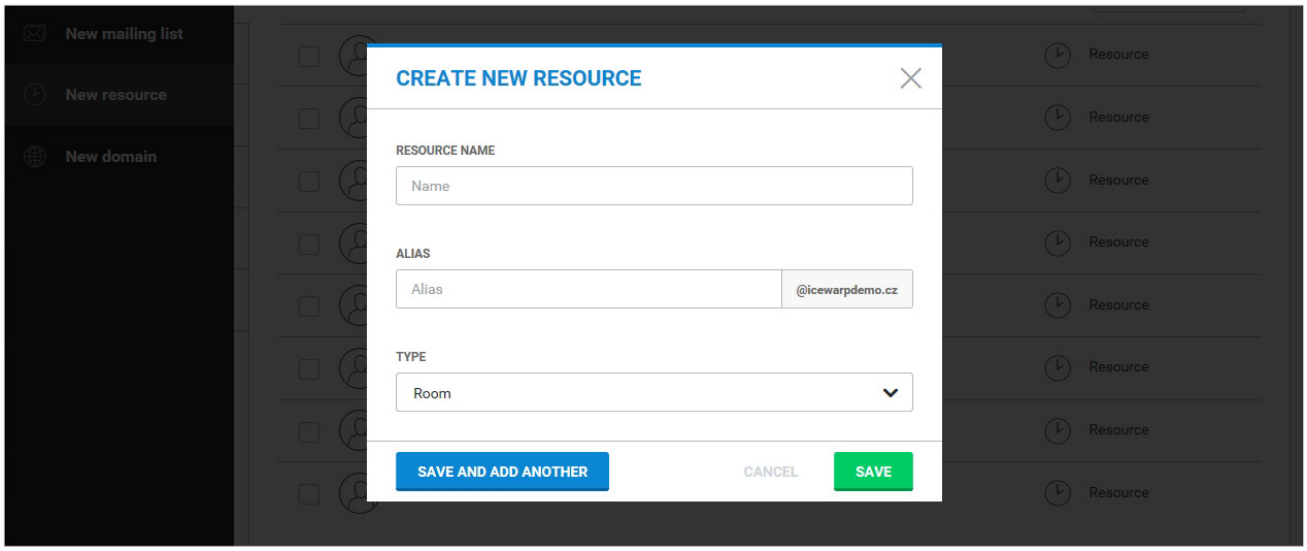

Login and Password Policy

Policy options offer powerful ways to secure user accounts against attacks or abuse by setting minimum password requirements or a number of failed login attempts.

Certificates

In this section administrators can generate the default SSL certificate, add multiple own certificates, or create CSR request to purchase commercial certificates that provide users with extended validation of the server they are connecting to.

Resource management

Added are the familiar options for creating resource accounts. Through resource calendars, organizations can manage and approve reservations for shared resources – such as meeting rooms, projectors, and cars.

Domain Diagnostic

The domain information tab displays summary of general information about the selected domain, its DNS records and running services ports (both TCP and UDP including port ranges). This helps administrators to review the DNS configuration with their service provider and ensure efficient server operation.

Webadmin to Webclient

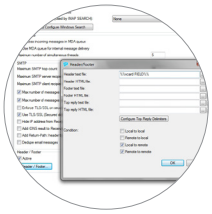

Administrators can switch back and forth between WebAdmin to WebClient without retyping the password.

Admin News

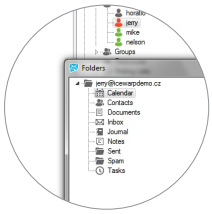

Welcome Message

The functionality has been improved so now there is no need to edit the configuration file manually; there is now a selection directly in the console Global Settings and domain Options. Administrators can use the IceWarp predefined template in several languages or upload their own customized template.

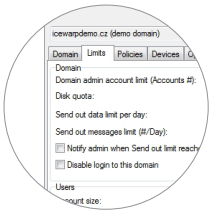

Global Signatures

The general header/footer dialog that is used at various places of administration console is extended with a new category – Top reply text/HTML file. The content of these templates will be inserted at the end of the top reply within each email.

Auto Subscription

This features saves time when preconfiguring shared folders for teams and groups. In just one click administrators can subscribe a shared folder to all user accounts with at least read permission to the folder. No access notification email is sent to users when an administrator makes a change to access permissions.

Send Out Limit Notification

To monitor for a spam outbreak coming from a user account that has been compromised, domain administrators can be notified when the domain or user send out limit is reached. The notification email will be sent to the account defined on the Domain tab.

Support for OS X 10.11

IceWarp Configurator is now compatible with the OS X El Capitan and lets users set up their collaboration and messaging applications on Mac. Unfortunately due to application restrictions, this version of IceWarp Configurator is not available from Apple App Store.

Free/Busy Availability on iOS

The enhanced meeting scheduling functionality in iOS 9 Calendar makes it easy to view coworkers' free/busy status when inviting them to meetings. When a conflicting event is found, it automatically suggests an alternative meeting time.
